Microsoft-Bullshit-Software

If you are one of those people, who have been increasingly annoyed with Microsoft for years, you should read on. In 2014, I had a computer, where my most sophisticated Excel macro took less than 3 minutes to execute.

3 years later, so in 2017, I bought a new computer, see below for details, where the same macro needs a response time of 4.5 minutes.

Computer	Tower PC of 2017
Processor:	Intel Core i7-7700K CPU 4.20GHz
RAM	32.0 GB
System	Microsoft Windows 10 Pro Version 22H2 64 Bit
Excel	Microsoft Office Home and Business 2019 64 Bit

Microsoft succinctly stated, that the Excel of 2019 allowed significantly more tables, rows, colors, etc. than older versions and therefore the macro response time had increased by 50%.

7 years later, in 2024, I wanted to buy a new computer, but I demanded, that the hardware supplier first measure the macro response time, which he did on the following top computer:

Computer	Tower PC by 2024
Processor:	Intel Core i9-14900KF CPU 6.0GHz (currently fastest processor!)
RAM	128.0 GB
System	Microsoft Windows 11 Pro Version 22H2 64 Bit
Excel	Microsoft Office Home and Business 2023 64 Bit

I was amazed that the macro response time was more than 7 minutes, so it has already increased by 56%! The supplier said it was not because of the hardware.

Ergo, it can only be due to the absolutely and idiotic Microsoft-Bullshit-Software!

The news has just hit the news, that Russian hackers have hacked Microsoft's carpet floor. Microsoft says, that all customer data is not affected. Anyone, who believes it, is an even bigger idiot, than all these Microsoft managers with their exorbitant salaries.

A search on internet forums revealed, that thousands of software developers around the world have encountered the exact same problems. Microsoft only says, that the macros should be optimized, i.e. we software developers ourselves are the idiots.

No, no, Microsoft-Bullshit-Software!

Microsoft in Redmont does not want to admit, that Windows 11 is absolute nonsense and that is why they're tinkering with Windows 12, which is due to be released in the fall of 2024 and would apparently require even more hardware resources. Reason: Mainly because of AI (artificial intelligence). Of course, if the whole Microsoft management is completely stupid, then they have to switch to AI, it's logical, isn't it?
